Do you have arm lymphedema following breast cancer treatment?

Do you want to participate in a study comparing two massage techniques?

- Researchers at the University of California, San Francisco (UCSF) are conducting a study to learn if treatment with a new negative pressure massage device is safe and effective, compared to manual lymphatic drainage massage, at improving swelling, skin condition, and movement in the arms of women with lymphedema.

- You may be able to take part in this study if you:
  - Have had lymphedema in only one arm, for at least one year
  - Your lymphedema has not changed significantly in the last 3 months

- Participants will be paid $50 for their time, have parking paid, and will receive 12 massage treatments for their lymphedema arm.

- Please contact the study investigator to find out more or to see if you are eligible:
